Profile

I am an experienced data scientist and technologist with a focus on building efficient, scalable systems. Expertise spans data analysis, ETL development, and cloud computing, driving cost-effective and reliable solutions. With a foundation in applied mathematics and scientific computing, I approach problems with precision and practicality.

Professional Experience

Performance Engineer, *Moviri*

2022 – 2024

Boston, USA

Responsible for designing data architectures and ETLs for the optimization of client's IT infrastructure. Developed practical experience writing software integrations in Java, connecting data sources across APIs, Cloud platforms and other endpoints, and creating SQL dashboards to build observability from end to end. This work resulted in a significant reduction of customer spending through exposed inefficiencies across their IT infrastructure.

Technology Support, *University of Washington Libraries*

2019 – 2021

Seattle, USA

Previously employed by the Information Technology Services & Digital Strategies department. Responsible for network administration of staff computers, as well as assisting with technological issues and support.

Network Simulation Intern, *MITRE Corp.*

2019

Boston, USA

Managed a project involving the simulation and analysis of radio communication over geographic data. Programmed in MATLAB, this project made use of scientific computation as well as graph theory to analyze simulated networks

Education

B.S. in Applied & Computational Mathematical Sciences,

2017 – 2021

University of Washington

Seattle, USA

GPA of 3.78

Skills

Data Engineering

- Skilled in building and managing scalable cloud-based architectures across platforms such as AWS, Microsoft Azure, and GCP.
- In-depth experience building data pipelines, connecting databases and APIs utilizing SQL and other query languages.

Software Engineering / Data Analysis

- Practical experience using Python and Java to build ETLs and software applications.
- Deep knowledge of software algorithms and their implementation for modeling and predicting data computationally.
- Hands-on experience using Linux and other developer tools for efficient DevOps.
